Lingway launches the release 3.2 of Lingway KM

Paris, November 22th 2004 - Lingway, editor of document management software based on language engineering, today announced the availability of Lingway KM 3.2, its upgraded version providing a multilingual semantic search engine for query, categorization and reading assistance, dedicated to knowledge management and to applications of text mining and information watch.

Lingway KM 3.2 upgrades include several features and especially a new module to develop applications for information watch:

* The information watch module : provides a powerful data acquisition engine ("Web crawler") compatible with all current formats (Office, html, pdf, ...) and with RSS threads, as well as a customizable management tool to deal with users and alert messages (management of users' identifications and rights, of alert descriptions related to a specific user or to a group of users).

* The upgraded linguistic analysis features are:

- Standardization of the generated meta-data (the synonymous extracted terms such as "government action" and "public action" are automatically gathered).
- Simplified user's dictionary (enabling to add easily simple or compound words and to modify the semantic network with an immediate update of the system).
- De-synchronization of indexation and extraction (a fast « full text » indexation is first carried out to manage warning messages and linguistic analysis (extraction of named entities and defining terms) is launched in asynchronous mode, as background task).
- Extension of recognition functions related to named entities (recognition of person's job and of legal type of a company).
- Improvement of generic dictionaries (in each version thousands of new terms are added, especially in products and services description and in tax system sector).

«With Lingway KM 3.2 companies can implement thanks to our ASP offer, a personalized information watch application in few minutes», says Bernard Normier, Lingway's Chairman and CEO.
